(substances (1), (3), (5) and (6)) or an opposite effect (substances (2) and (8)). All 7 substances form the furan-dicarbonylic acid owing to oxidation with  $H_2O_2$  and contain a coumarinic lactone the ring of which opens in alkaline medium and closes again in an acid one. These data (in addition to other physicochemical ones) permit the conclusion that the substances under review belong to the group of natural furocoumarins (Table 1). (1), (2), (5) and (6) are identical with the known furocoumarins: imperatorin (II), bergaptene (III), isopimpinellin (IV) and xanthoxol (V), respectively. This was confirmed by the production of several derivatives. The remaining substances: Pastinazine (3) and (7) could not be identified with any of the furocoumarins known so far. It may be seen from table 1 that they are very similar to substance (2) and, furthermore, they have identical  $R_f$  values in the chromatograms of 8 solvents investigated.

TITLE: Furocoumarins in the Fruits of Pastinaca Sativa L.  
 (Furokumaryny plodov pasternaka posevnogo Pastinaca sativa L.)

PERIODICAL: Doklady Akademii nauk SSSR, 1959, Vol 124, Nr 6, pp 1335-1338  
 (USSR)

ABSTRACT: The application field of Pastinaca and P. opopanax are presented (Refs 1-8). The authors investigated the spasmolytic effect of the substances contained in the seed of Pastinaca (of the variety Student from the Krasnodar and Stavropol' area) by chromatographic separation (Ref 9). They could isolate 7 crystalline substances. One of these substances called pastinazine by the authors exerted a pronounced spasmolytic effect and caused a vasodilatation in the heart, liver, kidneys and other internal organs in concentrations of  $1 \cdot 10^{-7}$  (Ref 10). It can be used in the treatment of some kinds of stenocardia (clinical investigations were performed by M. I. Shubov, Khar'kov, M. I. Zolotova-Kostomarova, Moscow, and S. N. Sime'nikov, Khar'kov). Some other substances obtained from Pastinaca seed exerted either a shorter

portant active substance of the seeds. According to the stated physico-chemical data erysimotoxin possesses an aldehyde group, two secondary and two tertiary hydroxyl groups, and one unsaturated lactone cycle of five links. Its sugar component is represented by one molecule of the 2-deoxy-sugar in the paper chromatographs - this component proved identical with digitoxose. According to the investigations of the glycoside, its acetyl derivative, its aglycone (the nonsugar component), and its sugar component, the mentioned structure can be attributed to erysimotoxin (see diagrams). Erysin is chemically a glycoside with a five-member lactone ring without 2-desoxy sugar. Thus altogether ten glycosides were found in the seeds. There are 3 figures and 10 references, 9 of which are Soviet.

TITLE: ~~The Cardiac~~ Glycosides in the Seeds of Treacle-Mustard (*Erysimum cheiranthoides* L.) (Serdechnyye glikozidy semyan zheltushnika levkoynogo (*Erysimum cheiranthoides* L.))

PERIODICAL: Zhurnal Obshchey Khimii, 1958, Vol. 28, Nr 5, pp. 1383 - 1387 (USSR)

ABSTRACT: In the present paper the author tried to investigate the proportion of glycosides in the seeds of treacle-mustard and to separate the most active one of them in crystalline state. In this investigation of the seeds by means of paper chromatography seven glycosides were found in more or less considerable quantities and three in small traces. By means of mild fermentative cleaving the author succeeded in separating from the seeds two glycosides in crystalline state with melting points of 196-197° and 224-226°C. The first named "Erysimotoxin" was obtained in a yield of 0.1%. Both glycosides are of high biologic activity and exceed in intensity strophanthine, zymarine, digitoxin, convallaside and other well-known cardiac glycosides. The high biologic activity and the comparatively high yield of erysimotoxin allow to refer to it as to the most im-

 TOPIC TAGS: methylmethacrylate, alkaryl ether, copolymerization, radical polymerization, copolymer, ion exchange resin, polymer structure  
 ABSTRACT: The copolymerization of hydroquinone dimethyl ether (I) with methylmethacrylate (MMA) was investigated. Bulk polymerization of 1-20% I with 99-80% MMA initiated by azobisisobutyronitrile gave 20% yields of cross-linked polymers whose ether linkage content increased with initial amount of I. Benzoyl peroxide initiated suspension copolymerization was carried out. The use of a combination of starch and talcum as suspension stabilizers was required in order to form copolymer granules. High copolymer yields (88%) were obtained when a 1:3 ratio of monomer mixture: water was used. The static exchange capacity

TITLE: Delayed neutrons and (n, nf) reaction on uranium isotopes

SOURCE: Ref. zh. Fizika, Abs. 6V163

REF SOURCE: Byul. Inform. tsentra po yadern. dannym, vyp. 2, 1965, 161-166

TOPIC TAGS: delayed neutron, fission neutron yield, uranium isotope, accelerator/Van de Graaf accelerator

ABSTRACT: Fission yields of delayed neutrons were measured during fission of  $U^{233}$  by neutrons with energies of 2.3, 5.6 and 7.25 Mev and of  $U^{235}$  by neutrons with an energy of 7.22 Mev. Experiments were made on a Van de Graaf accelerator with tritium and deuterium targets. A smooth variation in the yield ratio of delayed neutrons between the various cross-section plateaus, as well as abrupt jumps especially in the case of yields of delayed neutron groups with half-decay periods of 2.2 and 55 sec, were observed. The possible causes of yield ratio variations due to reaction (n, n'f) are analyzed. It is stressed that an interpretation of the results obtained necessitates the investigation of corresponding mass

in the fission cross section of Th-232 a change in the maximum energy of the neutrons by an amount equal to the halfwidth of the spectrum or even less (200-500 kev) gives rise to a noticeable change in the ratio of the group yields, even for a small halfwidth of the neutron spectrum (500 kev). The results are presented in tabular form and in the form of a graph. Orig. art. has: 1 figure and 2 tables.

ABSTRACT: This is a continuation of earlier work by the author (Symposium on the Physics and Chemistry of Fission, Salzburg, 22-26 March, 1965, SM-60/84) where it was shown that the yield ratio changes abruptly at the threshold of U-238 fission. Since the fission cross section of Th-232 near threshold is not a continuous function as for U-238 but has several maxima and minima, the author has measured the yield of the delayed neutrons of energy 1.6-2.6 Mev obtained in the reaction  $T(p,n)He^3$  with a Van der Graaff generator. The decay curves were processed with an electronic computer. The results show that in the vicinity of the first step

TITLE: Relative yields of delayed neutrons in the fission of  $U^{235}$  and  $U^{238}$

SOURCE: Atomnaya energiya, v. 19, no. 1, 1965, 46

TOPIC TAGS: neutron flux, slow neutron, nuclear fission, neutron interaction, enriched uranium, half life

ABSTRACT: The maximum fissioning-neutron energy was 6.0 Mev. A metallic sample of uranium, enriched to 90%  $U^{235}$ , was used. The over-all decay curve was obtained by making 20 runs and contained 700,000 counts. The resolution was by means of an electronic computer, using the matrix inversion method for specified half-life values. The measurements, like those previously made by the author (ZhETF v. 35, 815, 1958), point to a smooth variation of the yields with the fissioning-neutron energies. In the case of  $U^{238}$  the sample was irradiated with neutrons of maximum energy 1.75 Mev, from the  $T(p, n)He^3$  reaction in a Van de Graaff accelerator. In this case the results differ from earlier data, probably owing to channel effects. The results are listed in the Enclosure. Orig. art. has: 2 tables.

by neutrons having other energies. The results were calculated with an electronic computer, using the same decay constants for all energies. The results were also compared with the data for thermal neutrons (I. R. Kapin, *Atomnaya energiya* No. 4, 123, 1958) with which they agreed within 15%. The results are listed in Table 1 of the enclosure. It is concluded that the yield ratio varies smoothly with increasing energy of the fissioning neutrons, thus indicating that the decay curve is uniformly deformed. The variation of the yield ratio in the 1-5 MeV range is sometimes larger than in the 5-15 MeV range, meaning that the variation is more even before the reaction  $(n, n\alpha)$  enters into play. This reaction may also be responsible for the variation in the yield ratio as the neutron energy varies from thermal to 15 MeV. Orig. text, 1 page, formula and 1 table.

Abstract. To ascertain whether the dependence of the yield ratios of fission products on the fissioning-neutron energy is due to the resonance fission reaction, the authors have studied the fission of  $^{235}\text{U}$  induced by neutrons with maximum energy 0.5 MeV obtained from the  $^{239}\text{Pu}(\alpha, n)^{235}\text{U}$  reaction in a Van de

Journal: Engineering 1 (Novaraya) Moscow, No. 5, 1965, 54

Topic: delay neutron, reactor, neutron counter

ABSTRACT: This author certificate describes an instrument for measuring delayed neutrons. It contains a block counter filled with BF<sub>3</sub> moderator. To improve the efficiency of the delayed neutron counter, the counter is surrounded by a uranium-235 layer in such a way that the resulting system takes the appearance of a high-power subcritical reactor.

The Relative Yields of Delayed Neutrons in the Fission of  $U^{238}$ ,  $U^{235}$  and  $Th^{232}$  on Fast Neutrons.

tically no background. The decay curves for one and the same element which were determined by various experiments are united into a single curve. Five groups of delayed neutrons were distinguished. A sixth group was not determined separately because of its low intensity and short life. All curves were calculated by the method of the smallest squares; measuring results are given by a table. The author thanks O. D. Kazachkovskiy for valuable directions and for his interest in this work. There is 1 table.

The Relative Yields of Delayed Neutrons in the Fission of  $U^{238}$ ,  $U^{235}$  and  $Th^{232}$  on Fast Neutrons (Otnositel'nyye vykhody zapazdyvayushchikh neytronov pri delenii  $U^{238}$ ,  $U^{235}$  i  $Th^{232}$  na bystrykh neytronakh)

PERIODICAL:

Zhurnal eksperimental'noy i theoreticheskoy fiziki, 1958, Vol 35, Nr 3, pp 815-816 (USSR)

ABSTRACT:

The present paper contains a report on the measurements carried out of the relative yields of delayed neutrons in the fission of natural uranium,  $U^{235}$  (90% enriched) and  $Th^{232}$  by neutrons having an energy of 15,0 + 0,9; 3,3+ 7 and 2,4+ 0,3 MeV. The 15,0 MeV neutrons were produced by bombarding a thick tritium target with 440 keV deuterons. The reaction  $D(d,n)He^3$  served as a source of the neutrons with 3,3 and 2,4 MeV. Also gauging was carried out on thermal neutrons. As detector, a block with four counters with  $BF_3$  was used, which were connected in parallel and were surrounded by paraffin. Two series of irradiations lasting 300 and 30 seconds respectively were carried out. Measurement took 360 and 30 seconds respectively. During measurements there was prac-

TITLE: Study of the microstructure of Al-Cu-Ni alloys

SOURCE: Ref. zh. Metallurgiya, Abs. 9I467

REF. SOURCE: Visnyk Kyivsk. un-tu. Ser. fiz. ta khim., no. 6, 1966, 10-11

TOPIC TAGS: aluminum alloy, copper containing alloy, nickel containing alloy, metal grain structure, grain size, metal heat treatment

ABSTRACT: Ingots of alloys of Al with 4% Cu and 0 - 2% Ni were deformed and annealed at 400° for 10 hours. The microstructure was investigated after annealing at 400°, quenching from 540°, and natural and artificial aging. With increase of the Ni content, the grain size decreases, and the boundaries expand and lose their continuity. The grain size and the state of the boundaries are practically unaltered by heat treatment. The decrease in the grain size is connected with the fact that Ni decreases the grain energy. From the Resume. [Translation of abstract]

TITLE: Switching Characteristics of the Dry Circuit Breakers, Model N 107-III-40, Under Special Working Conditions 25

PERIODICAL: Wiadomości Elektrotechniczne, 1959, Nr 8, pp 238-240 (POL)

ABSTRACT: The article describes tests made on the Polish-manufactured circuit breakers of above type, originally constructed for a-c, but to be used with both d-c and a-c loads up to 80 amperes (550 volts a-c, 275 volts d-c) by laboratories testing electrical equipment for quality and for awarding the "Seal of Approval". After extensive tests for reliability and efficiency consisting of 5,000 switching operations (on-off) under full loads (275 volts - 35 amperes, 2,750 volts - 80 amperes, and 550 volts - 80 amperes) it has been found out that they can completely replace the more expensive model "SP" designed for d-c. ✓

TOPIC TAGS: shell, circular shell, cylindric shell structure, stress analysis, stress distribution, shell deformation

ABSTRACT: A continuation of results is presented on the polarization-optical investigation of thick-walled cylindrical shells. The earlier work was described by T. D. Maksutova (Fotouprugoye issledovaniye tolstostennykh sosudov s ploskim dnishchem. Issledovaniya po uprugosti i plastichnosti. Sb. 3. Izd. LGU, 1964). The aim of the current article is to obtain the most complete description possible of the stressed state as a function of values of parameters characterizing the geometry of shells. Previous work was involved with studying the effect of the ratio of the inner radius  $R_1$  of the cylinder to the outer radius  $R_0$  on the stressed state of a cylindrical shell with a flat circular bottom of constant thickness. In the current article  $R_1/R_0$  is

Responsible Editor: B. P. Sukhobolov; Ed.: Ye. V. Shchegoleva; Tech. Ed.: S. V. Voznesenskaya; Editorial Board: S. G. Ostman, L. M. Kacharov, V. M. Krasov, Z. D. Makintova, N. I. Prigorovskiy, V. M. Prokhorov, N. B. Rozhnov, and Ye. I. Edel'shteyn.

**CONTENTS:** The collection contains reports presented at the conference on optical polarization scheduled in towns and villages held February 13 - 21, 1968, in Lodz and attended by 334 delegates including representatives of the People's Republic of China, the Polish People's Republic, the German Democratic Republic, and the Republic of Czechoslovakia. The reports discuss general theoretical

problems and new methods of investigation and describe the equations and materials used in the solution of specific two-dimensional and three-dimensional problems. Solutions of specific problems are given in detail and detailed problems occurring in hydroplastics, aircraft design, engine construction, in various branches of heavy and precision machine design, in mining, metallurgy, hydraulic structures, railroad transport, in structural mechanics, electronics, in the control of stresses in products of the glass and electronic industry, etc., are given. Solution of the three-dimensional problems by means of the method of potentiality is introduced and the use of this method for the solution of problems associated with plasticity, creep, dynamics, hydrodynamics, etc., is demonstrated. Reports previously published elsewhere are printed here in abbreviated form. No potentialities are mentioned. References are listed at the end of the reports.

The Building of **Complex Form Models** For the Optical Method 32-2-45/60  
of Tension Investigations

tion. A table of suitable alloys is given. The model molds themselves can be cast in plaster. An alloy of 40% Pb, 40% Sn, 20% Sb is said to be of good castability and is recommended for decomposable model molds. The method described makes it possible to construct models with an exactitude of  $\pm 0,05$  mm. There are 2 figures, 2 tables, and 7 references, 4 of which are Slavic.

TITLE: The Building of Complex Form Models for the Optical Method of Tension Investigations (Izgotovleniye modeloy slozhnykh form dlya opticheskogo metoda issledovaniya napryazheniy)

PERIODICAL: Zavodskaya Laboratoriya. 1958, Vol. 24, Nr 2, pp. 231-233 (USSR)

ABSTRACT: In order to destroy the "edge effect" in optically active materials a method of modelling was developed which also renders a mechanical treatment of the finished models unnecessary. The method is based on the casting of synthetic resin in metal molds, and on the out-polymerization of the resin used here. With this attention must be paid to the possibility of the escape of bubbles. A table is given of those synthetic resins that can be used here, and of their specific properties. With a bakelite (CF) casting a strong edge effect could be noticed whilst the best results were given by "epoxy-resins" with maleic anhydride as hardener. The undecomposable model molds should consist of metal alloys with a narrow melting range ( a little above the maximal polymerization temperature of the synthetic resin) so that they can easily be melted off after the resin polymeriza-

### Experimental Investigation of the Stresses in a Hydraulic-turbine Blade

to the thickness of the blade profile and subjected to the same thermal and other conditions as the blade model, but free of any external forces. It is shown that in the bakelite used an "edge effect" arises as a result of desiccation, i. e., the separation of component substances, mainly water and phenol, and that a working medium may be found in which the "edge effect" does not occur. In a practical attempt to avoid any "edge effect" the model was loaded in a water-glycerol mixture and was protectively coated with latex. The interpretation of the stress conditions in the blade was performed according to the formulas of three-dimensional photoelasticity. The results lead to the conclusion that the blade, considered as a shell with variable thickness, is subjected to pure moment stresses. A comparison with L. M. Kachanov's solution (Rzh Mekh, 1955, abstract 906) is also adduced.

ABSTRACT: Presentation of an experimental investigation of the stresses prevailing in a hydraulic-turbine blade subjected to the action of a pressure uniformly distributed over its working surface. The investigation was conducted by means of the photoelastic method, wherein the model was "frozen" and subsequently sectioned off. The model was made of bakelite; the bakelite resin was cast into a mold made of a readily fusible alloy. The uniform pressure was exerted by means of a system of glass rods located vertically on the working surface of the blade. In the determination of the stresses due to the edge effect, use was made of data on the "edge effect" in a bakelite wedge having a thickness equal

TITLE: Effects of radial clearance on turbine characteristics

SOURCE: Energomashinostroyeniye, no. 1, 1966, 28-30

TOPIC TAGS: turbine efficiency, turbine design, turbine, turbine blade, turbo-machinery

ABSTRACT: Experiments were performed at the Kazan' Aviation Institute on two types of blades to determine the effects of radial clearance on turbine characteristics. The characteristics were obtained as functions of speed and of radial clearance (to  $\delta/l = 9\%$ ), and radial and circumferential flow profiles were obtained at the turbine wheel inlet and outlet. Efficiency as a function of speed and radial clearance for the two types of blades is shown in Fig. 1. Circumferential profiles at 4 radial positions were found to be essentially unaffected by the radial clearance. The radial profiles of  $\alpha_1$ , reactivity  $\rho$ , specific flow rate  $G/EG$ ,  $\alpha_2$ , and dimensionless speed  $\lambda$  for one type of blade are shown in Fig. 2 for various radial clearances. The degree of reaction was also calculated from

Abstract: The losses caused by radial play in the working rotor of a turbine

are determined by the method of simulation (based on eqn. 1), where

$G$  is the rate of flow of the gas through the turbine, and  $G_0$  is the rate of flow of the gas through the

lost. The method described is more convenient and useful in the development of  
turbines, and the present method makes allowance for the effect of play on the  
losses in the turbine. The losses in the turbine are determined by the flow sectioned  
method, taking into account the radial play, bearing  
of a single-stage turbine, are discussed. Two  
turbines were tested under compressed air conditions. The problem

that the comparison of turbine operation on gases with different adiabatic indices  $k$  should be made in regimes having similar velocity triangles. In this case the values of the efficiency and reactivity remain unchanged. The similarity of velocity triangles may be maintained only at subcritical flow regimes. Strictly speaking, the similarity is only slightly disturbed in the case of supercritical regimes. The difference does not exceed 1% in the case of the efficiency coefficient. Orig. art. has: 10 formulas.

TITLE: Influence of the adiabatic index  $k$  on turbine characteristics

SOURCE: Teploenergetika, no. 8, 1964, 29-33

TOPIC TAGS: turbine test, turbine operation medium, adiabatic index, aviation turbine

ABSTRACT: The influence of the properties of the working medium on the operation of a turbine is evaluated and the transfer of the results of turbine tests obtained with one medium to the actual operating medium is analyzed on the basis of the similitude theory. An analytical method is proposed to account for the influence of the adiabatic index  $k$  in various regimes of the turbine. The adiabatic index  $k$  is, together with the viscosity and gas constant, one of the basic characteristics of the operating gases which influence the regimes of the turbine. It is assumed that the velocity coefficients  $\phi$  and  $\psi$  and the flow direction in the interblade channels are independent of the gas composition. This analysis leads to the conclusion

PURPOSE AND COVERAGE: This is a systematized textbook on gas turbines for aviation higher technical institutions and can be used at the same time by gas-turbine designers. It contains the theory, methods of calculations, and a review of constructions of gas turbines employed in aviation gas-turbine and liquid-fuel-jet engines, and also in auxiliary aircraft engines. It deals with the working

the blading also alters. Therefore, before the adjustments are made, it is necessary to determine which operating conditions of the turbine correspond to critical velocity of flow at discharge from the nozzle or runner blades. If critical conditions are found to occur first in the runner, the maximum flow is determined from the limiting value of the referred flow speed at discharge from the nozzle, which can itself be found from the inlet velocity triangle. There are 1 figure and 3 Soviet references.
